Air India
Design and Code Structure

Design Changes and Process

The document refers to Air India website designed and coded by me. It was fun and not so complicated coding for CSS part of the website as there was already a clear HTML structure which made it less complex for me to add CSS components to it. While coding for the CSS files I made sure that I wrote different classes and ids with proper syntax because in the beginning, the code was not working, then later I realized that in CSS I had given space in some class names, instead of which there should have been a dash. So, these minute and small details create big problems.
One more major thing I encountered was, while I was changing the CSS the grid was getting off sometimes so to fix that I coded each feature one –by-one, so like for hover on a button, I coded the background of the button and checked it that happened and then proceeded to code further.

There were a set of things that I wished to do but failed executing, like hovering of one image with the text over the other image with some other text. Changing the size of section tabs and making it a different color with respect to its section, and some more.
